

React Hooks Research

React Hooks are features in React that help developers use state and other React features inside functional components.

1. **useState:** Used to store and update data such as counters, form values, and user inputs.
2. **useEffect:** Used to run code after a component is rendered, such as fetching data from an API.
3. **useContext:** Used to share data between components without passing props many times.
4. **useRef:** Used to keep a value between renders or access HTML elements directly.
5. **useReducer:** Used to manage complex state changes in a more organized way.
6. **useMemo:** Used to improve performance by saving calculation results.
7. **useCallback:** Used to save functions and reduce unnecessary re-rendering.

Conclusion: The most commonly used React Hooks are useState and useEffect because they are needed in most React applications.
